#### 1. Abstract

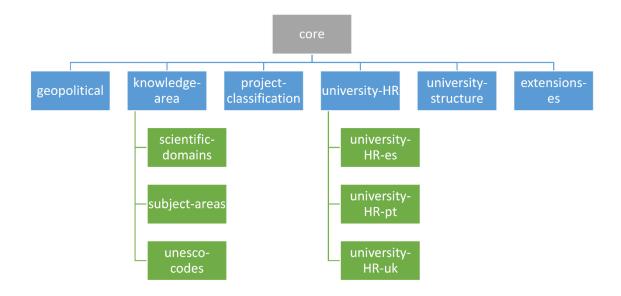

The aim of this document is to provide a bird's eye view on the entities modelled within ROH. The document includes an overview in tabular form for each of the core entities of the network of ontologies ROH, giving details on the object and data properties supported by each of them. This document is meant to be useful when instances of ROH want to be created, since it clearly explains what entity types a given entity type relates with through an object property and what data properties are supported by a given entity type, including details about its associated object types.

This document should be read as a complement to the <u>ROH Tutorial document</u> which describes more verbosely the purpose of the core entities of ROH and their relationships with other entities in the ontology.

#### 2. Ontologies used

The following table lists all ontologies created, which combine entities defined specifically in our core ontology under prefix roh with those reused from other well-known and extensively adopted ontologies. Notice that ROH network of ontologies is divided into 2 main parts as depicted in the following figure:

- The generic ontology, core module, contains the most important entities and properties to
  model information in the academic domain. It contains the central part of the network of
  ontologies. It covers the academic domain, being agnostic to the country or the research
  organization whose information wants to be modelled with.
- A set of vertical modules which include, on one hand, specializations of some academic concepts for a given country domain. For instance, the figure Associate Professor in the Spanish academic domain would be encountered in the vertical module university—HR-es and is assigned the URI http://purl.org/roh/university—hr/es#ProfesorTitularDeUniversidad. On the other hand, these vertical modules, include controlled vocabularies, according to SKOS ontology, for different important areas in the academic domain, namely, geographical locations (geopolitical), knowledge areas (including concepts for scientific—domains, subject—areas or unesco—codes), classification of project types (project—classification), resource positions in universities (university—HR for Spain, UK or Portugal), controlled vocabulary with all universities in Spain (university—structure) or some extensions for the Spanish university system (extensions—es).

The following table illustrates the name spaces of the ontologies used within ROH:

| Prefix  | Ontology name   | Ontology namespace                          | Ontology website   |
|---------|---|---|--|
| bibo    | Bibliographic Ontology  | http://purl.org/roh/mirror/bibo#            | http://bibliontology.com/  |
| cito    | CiTO, the Citation Typing<br>Ontology                             | http://purl.org/spar/cito#                  | https://sparontologies.github.io/cito/current/cito.html                          |
